**Abstract:** We document the first record of *Boa constrictor* in Valle Fértil department, San Juan province, Argentina. The specimen was collected and deposited in the herpetological collection of the Department of Biology, Universidad Nacional San Juan. This record extends the known distribution for this species in San Juan province by 105 km.

**Keywords:** *Boa constrictor*, Argentina, San Juan province, Chaco Occidental, distribution

## INTRODUCTION

The genus *Boa* is represented only by one species, *Boa constrictor* (Vences et al. 2001). This is one of the largest and most widely distributed snakes in America, showing great plasticity in the occupation of different ecosystems. Its distribution extends from northern Mexico to central Argentina, except Chile and Uruguay. It inhabits rainforests, savannas, forests and semi-desert scrub of most tropical and subtropical areas of the continent. Because of its wide distribution, morphological variability and the lack of taxonomic and systematic studies (Scrocchi, pers. comm.), several subspecies have been named (Langhammer 1983; Peters and Orejas-Miranda 1986; Price and Russo 1991). *Boa constrictor occidentalis* is the southernmost subspecies (Bertona and Chiaraviglio 2003).

*Boa constrictor occidentalis* is associated with burrows of vizcachas (*Lagostomus maximus*), for both prey and refuge (Ceí 1993; Sironi et al. 2000). Males and females reach sexual maturity at an average snout–vent length (SVL) of 149 cm and 164 cm, respectively (Chiaraviglio et al. 2001). The species is subject to strong human pressures for skins and the pet trade (Ávila and Acosta 1996), and its habitat is being severely modified by intense farming and cattle raising in Argentina. As a consequence, it is considered a threatened species (Giraudo et al. 2012; Acosta et al. in press) and has been

included in Appendix I of CITES (2014).

The systematic listing of Argentine snakes (Giraudo and Scrocchi 2002) shows *B. c. occidentalis* occurring in 13 provinces: Chaco, Formosa, Salta, Jujuy, Tucumán, Santiago del Estero, Santa Fe, La Rioja, Catamarca, Córdoba, San Juan, San Luis and Mendoza. It is distributed mainly in the ecoregions of Chaco Oriental, Occidental and Serrano, and the northwest of Espinal (Di Fonzo de Ábalos and Bucher 1981; Reati 1996; Chiaraviglio et al. 1998). In San Juan province, existing data are scarce and mostly anecdotal. In this note we confirm the presence of *B. c. occidentalis* in Valle Fértil department of San Juan province, constituting the first record with voucher for this department. Precise information on its distribution is also provided.

On 28 December 2014 at 23:56 h we found a road-killed juvenile *B. c. occidentalis*, SVL 137.7 cm, on Provincial Route 510, 20 km south of San Agustín de Valle Fértil (30°48'03" S, 067°22'04" W, 762 m above sea level) (Figure 1). The specimen was collected and deposited in the scientific herpetological collection of the Department of Biology, Facultad Ciencias Exactas, Físicas y Naturales, Universidad Nacional San Juan (UNSJ-2098).

The individual was identified as *B. c. occidentalis* by morphological comparisons with reference material in the herpetological collection of UNSJ, and verified by Juan Carlos Acosta.

In Argentina, the distribution of *B. c. occidentalis* has not been studied in detail. However, there are several studies that have contributed information about its range. *Boa constrictor occidentalis* has been reported in provinces of Chaco (Kacoliris 2006; Alvarez et al. 2009), Formosa (Lions et al. 1997; Alvarez et al. 2009), Santa Fé (Arzamendia and Giraudo 2002; Bosisio and Trucco 2002), Córdoba (Di Fonzo de Ábalos and Bucher 1981; Chiaraviglio et al. 1998; Briguera et al. 2005; Pelegrin et al. 2006), San Luis (Jackson 1986, Ávila and Carrizo 2003; Guerreiro et al. 2005), Salta (Cruz et al. 1992; Lavilla et al. 1995), Mendoza (Ceí and Roig 1973),

**Figure 1.** *Boa constrictor occidentalis* UNSJ 2098 on Provincial Route 510 in Valle Fértil department, San Juan province, Argentina.

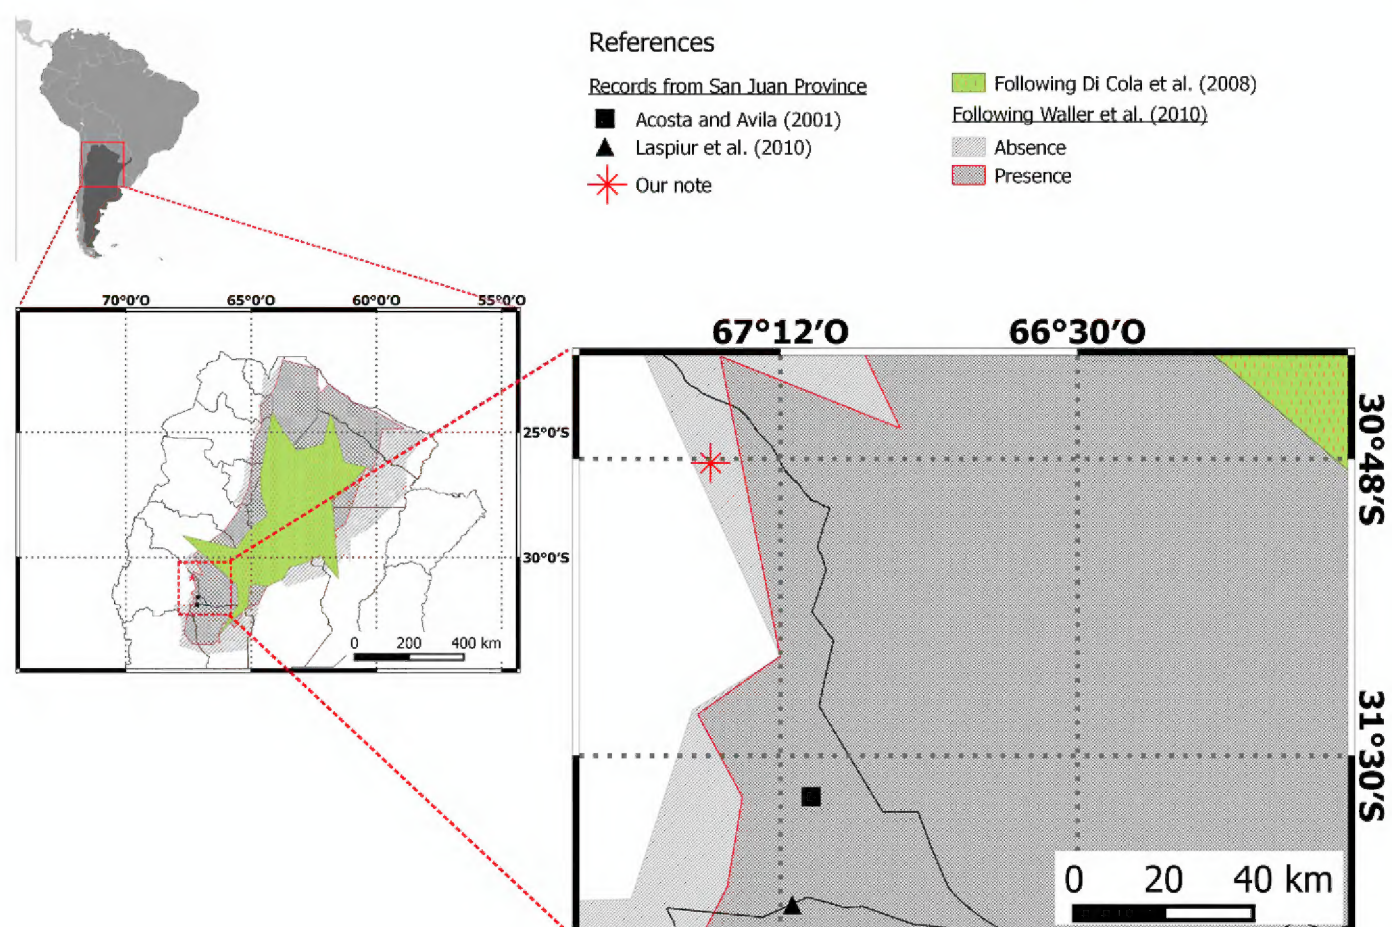

Tucumán (Laurent and Terán 1981), and San Juan (Ávila et al. 1998; Acosta and Ávila 2001; Laspiur et al. 2010). Giraudo and Scrocchi (2002) also included it in La Rioja, Santiago del Estero, Jujuy, and Catamarca. Recent studies have attempted to represent its distribution in Argentina based on observational records according to several environmental factors (Di Cola et al. 2008), and through surveys (Waller et al. 2010) (Figure 2).

According to Ávila et al. (1998), *Boa constrictor occidentalis* occurs in east-central San Juan province. Cei and Castro (1978), report it from Sierra Guayaguas and Pampa del Gigantillo, 25 de Mayo department, and also Valle Fértil department, but without voucher material. The presence of *B. constrictor occidentalis* in the province was confirmed, with reference material, in Caucete department, in the southeastern part of the province (Acosta and Avila 2001). Laspiur et al. (2010) observed

an adult in the Sierra de Guayaguas, 25 de Mayo department, the most recent record for the province.

The site reported in this note is in the Chaco Occidental ecoregion, which is consistent with previous reports (Di Fonzo de Ábalos and Bucher 1981; Reati 1996; Chiaraviglio et al. 1998; Acosta et al. 2000; Laspiur et al. 2010). Our record extends the distribution in San Juan 105 km north, in the eastern part of the province. It also extends its distribution area in Argentina 121 km farther west from the range predicted by Di Cola et al. (2008) and 8 km west of that predicted by Waller et al. (2010) (Figure 2).

Specimens of *B. c. occidentalis* are rare in herpetological collections, making it difficult to determine its precise distribution (Acosta and Ávila 2001). Previous records of the subspecies in Valle Fértil are anecdotal (Cei and Castro 1978). Here we confirm for the first time for

**Figure 2.** Distribution of *Boa constrictor occidentalis* in Argentina. Green Area: Distribution area according to Di Cola et al. (2008). Grey Area: Distribution area according to Waller et al. (2010). Light Grey: Absence area according to Waller et al. (2010). Square: individual registered in Caucete department by Acosta and Ávila (2001). Triangle: individual registered by Laspiur et al. (2010) in 25 de Mayo department. Star: New record that confirms the presence of the subspecies in Valle Fértil department.

this department the presence of *B. c. occidentalis* with reference material in scientific collection and extends its known distribution in Argentina.

## ACKNOWLEDGEMENTS

We thank Gustavo Fava for his help in making the map. We also thank Nicolás Sisterna for his assistance in translating earlier versions of this manuscript.
